

Data Cable Connection Instructions (Type 1)

Connecting a data cable to your computer and phone is a very simple process, as it is simply a matter of plugging in the cable at both ends. Any complexities involved through the use of a data cable will arise when you start to use software, not when connecting the cable.

1. Locate the data connector on the bottom of your phone.
2. Plug the connector into the phone, making sure that it is in the right position and has clicked into place. If the connector falls out then you have not inserted the connector correctly. Make sure that it locks into position.

3. Locate the 9-pin RS-232 serial port on the back of your computer.

4. Insert the cable into the 9-pin RS-232 serial port and then lock the connector into place by turning the two thumb screws.

5. Turn on your mobile phone.
6. Turn on your computer and then run the required software. Suitable software is recommended in the item description page on our web site.
7. Check all the software settings are correct, and read our software tips and trouble-shooting sheet if your software is causing you problems.

Note: Pictures are for reference purposes only. The procedure may differ depending on the model of phone. Always read the text description as well.
